

*Same as well
Just better*

SAME YOU SINCE 2009
JUST BETTER

Welcome, to the beginning of your DevOps career!

- Arman Gyulbudaghyan (Me) – Head of DevOps @ Grid Dynamics
- Experience: Enterprise Modernization for Fortune 500s (Macy's, Home Depot, HelloFresh, O'Reilly Auto Parts).
- Creator: "CodePal" (AI Code Assistant) and "SeidoDev"
- My Philosophy: "Smart Laziness." (If you do it twice, automate it).

Course Philosophy & Roadmap

The Path

- Linux/Python (The Foundation)
- Docker/AWS (The Infrastructure)
- Terraform/IaC (The Automation)
- K8s/GitOps (The Orchestration)
- AI/Capstone (The Future)

The Mindset: DevOps is not a toolset; it is a culture of shared responsibility.

Lesson 1

DevOps Methodology & Linux Foundations

Now, answer this:

What is DevOps?

The Problem: The "Wall of Confusion" between Development and Operations.

The Solution:

- Agile/Scrum: Iterative development, fast feedback loops.
- SDLC (Software Development Life Cycle): Plan -> Code -> Build -> Test -> Deploy -> Operate -> Monitor.

Key Concept: We shift left. We catch errors before they hit production.

The Bridge: You act as the translator between software developers and system administrators.

Automation First: Writing scripts and Infrastructure as Code (IaC) to eliminate manual clicking.

Pipeline Building: Creating CI/CD pipelines to ensure code travels safely from a laptop to production.

Observability: Setting up monitors to catch server fires before the customer ever notices.

The Anatomy of Linux:

- Hardware: CPU, RAM, Disk.
- Kernel: The boss. Talks to hardware. Managing resources.
- Shell: The translator. Takes your commands, tells the Kernel what to do.
- User Space: Where your applications (and you) live.

Why Linux? It powers 90% of the public cloud. It is the language of the server.

The Cloud Standard: Linux runs over 90% of public cloud infrastructure (AWS, GCP, Azure).

GUI vs. CLI: Graphical User Interfaces consume heavy resources. The Command Line Interface (CLI) is lightweight, fast, and scriptable.

Everything is a File: In Linux, hardware, configurations, and processes are all treated as files, making automation highly predictable.

Your New Best Friend: The Terminal.

/ (Root): The beginning of everything.

/bin & /usr/bin: Essential user binaries (commands).

/etc: Configuration files (Where we tweak the system).

/var: Variable data (Logs, spool files). Crucial for debugging.

/home: User personal data.

/opt: Optional or Log data.

/tmp: Temporary files.

"Don't memorize flags. Understand streams."

The Big 5:

- cd: Move)
- ls: List/View current directory
- pwd: Print working directory
- cat: Concatenate
- grep: Global regular expression print

And millions more.....

Now, it's time for the Quiz

Lab Setup: Instructions will be sent by me on Discord.

Task: Install VM and run your first Linux or use Linux/Mac

Challenge: Find the largest file in your /something directory using command line only.

Advanced (Optional): Write your first Bash/Zsh script!

Mega Advanced (Optional): Install Arch Linux in your task
